

Lone Wolf Forensic Analysis Report

INFR 4690U
April 13, 2026
Yasamin Fayyaz

Andrew Bentley (100878197)
Haroon Jemal (100790378)
Ryan Chung (100867856)

Executive Summary

The report presents a clear and detailed overview of a digital forensics investigation into the horrific activities of a suspect identified as Jim Cloudy. The investigation's scope involved analyzing verified forensic reports and datasets provided by a forensics team. Rather than examining the original disk image directly, Investigators had chosen to conduct a review of authenticated materials, including CSV files, browser artifacts, and documented system information. The sources contained validated disk image hash values, device specifications, and operating system details, acquisition records ensuring the integrity and reliability of the evidence while preserving the chain of custody.

The primary evidence consisted of structured datasets that allowed investigations to reconstruct the suspects' digital activities. An analysis of the CSV files provided revealed the extensive browser history, cloud storage usage, account creation dates, and saved account login credentials that from Jim's machine. These artifacts showed the suspect had used multiple online platforms and services, such as Amazon Web Services, Google Drive, Dropbox, Box, OneDrive, and Twitter, primarily registered under a single email address. Jimcloudy1@gmail.com. The evidence strongly indicated that Jim's use of AWS credentials, which were stored in a file named rootkey.csv. Further confirmation that the suspect had depended on cloud infrastructure to store and back up sensitive materials.

Additional findings from the suspect's browser history and image analysis had revealed searches, downloads, and cached images related to weapons, extremist propaganda, travel arrangements, and potential target locations. Recovered screenshots and metadata linked the suspect to flight planning, online research, and coordinated digital preparation. These artifacts established a clear timeline of activity between late March and early April 2018, demonstrating progression from research and account setup to operational planning.

Jim's device specifications had provided forensics with further insight into the investigation. The suspect used a system equipped with 16 GB of RAM and a 500 GB storage drive, along with a Samsung Galaxy S9 for capturing images. The following link between timestamps, file paths, and verified hashes enabled investigators to reconstruct events with speed, precision, and reliability. Ultimately, the findings demonstrate premeditation and coordinated digital behaviour. The investigation concludes that the suspect systematically used online resources and cloud services to plan and organize activities.

Moving along, the analysis had revealed deliberate redundancy through the use of multiple cloud storage platforms, ensuring that critical files were preserved and accessible across different services. This attempt at secrecy had highlighted the suspect's strategy to safeguard digital materials and avoid data loss. Communication records, synchronized files, and

corroborating timestamps strengthened the evidentiary timeline and supported the investigative conclusions. Together, the findings are able to come finish a puzzle that provides a comprehensive understanding of the suspect's digital footprint and offer actionable intelligence for legal, investigative, and prosecutorial purposes.

Evidence Examined

The forensic findings presented in this report were based on a collaborative group review of documentation prepared by a specialized digital forensics team. Rather than conducting a direct examination of the original disk image, the group analyzed verified forensic reports and extracted datasets. These materials included documented disk image hash values, device specifications, operating system information, acquisition tools, and acquisition dates. This approach ensured that all conclusions were grounded in evidence that had already been authenticated and preserved according to established forensic standards, thereby maintaining data integrity and the chain of custody. Hash values match across docs, proving that the evidence isn't altered, keeping the chain of custody. MD5 hashes from the Chrome cache confirm the data's authenticity. Each hash acts as a digital fingerprint. One bit change causes the whole hash to be altered, proving that this method. This method follows the best practices to avoid contamination.

The main evidence was CSV files from the teams. The CSV's allow us to rebuild Jim's actions step by step. The datasets contained critical information held in the CSVs, such as Google Chrome's search history, like searches for rifles, MP5s, TSA cash smuggling, and non-extradition countries such as Vietnam and Indonesia, and anti-gun rally sites near Washington, DC. Cloud Data pointed to AWS S3 in rootkey.csv, OneDrive, Dropbox, Google Drive, and Box accounts all tied to jimcloudly1@gmail.com or jimcloudy@outlook.com. Account started March 27-28, 2018. Browser sessions in the CSVs contained information such as the logins, timestamps, and URLs. There was an AWS sign-in at 11:53 PM on March 27, 2018, and then a Twitter setup the next day. For our Image and media analysis, we found artifacts in the Chrome cache displaying guns, Nazi quotes, Washington, DC, and flight bookings to Denpasar on American Airlines. Files such as f001a20 (rifle image), f0018c8 (anti-gun control with Nazi symbol), and 2018-04-03(screenshot of DC to Bali flight) were found on jcloudy's system. The paths were traced to the cache. In our analysis on web download,s we found downloads on RedGuns.jpg, BladeofGrass.jpg (anti-invasion mindset) added proof on focused research over 36 hours from March 31, 14:41 to April 1, 21:48.

Device specs from the docs stated that it had 16 GB RAM, a 500 GB drive, Windows OS, specifically Windows 10, and a Samsung Galaxy S9 for photos with EXIF data specifically from February 23, 2018. This shows the jcloudy uses a standard laptop for browsing, cloud sync, and planning. The CSVs had paths, timestamps, and hashes for full timelines. Patterns were shown,

such as account creations, chatting with brothers on April 6, and checking the weather for the Dulles Airport on April 6 at 8:25 AM.

According to this information, Jim planned a town attack in Pontiac Falls, Virginia, over gun control votes, researched submachine guns, Velcro tear-away clothes, gloves to hide prints, and escape through Dulles to Vietnam and Indonesia. The backups on the cloud ensured that the files stayed intact. There's also information on his brother tipping off authorities, stopping the plan. All conclusions hold up in court because of the verified sources. This indirect review allowed us to save time while keeping our evidence unaltered.

Document Recovery Analysis

When looking through the discovery module and recent documents in Autopsy, 6 key documents were found showing clear planning, intent, and ideological support for the attack. The planning document shows the clearest planning for the operation. It lists a gun-free zone near an airport, likely to execute the plan and escape. Document lists weapons, supplies, including black market guns, 9mm ammo, a Kel-Tec Sub 2000, gloves, special clothing, and cash. The escape section points to Indonesia or Vietnam, same-day tickets, and a ready suitcase. This suggests that Jim had an advanced plan for flight after the attack. Lastly, it saves his thoughts in separate cloud locations for remote access. The other document mentions his stress and doubts, but also his commitment to the “just” cause. He worries about snow and flight delays, which points to a travel link. He says he is saving everything in cloud storage.

Planning.docx: The planning document outlines the attack. The target is a Gun-free zone near an airport with an escape. It mentions the supplies such as Black market guns at the Northern VA Gun Works, Nova, 1000 9mm ammo priced at 360, a Kel-tec Sub 2000 for \$400, gloves, velcro clothes, and cash. Document mentions escape to Indonesia/Vietnam, ensuring no extradition,

same-day tickets, suitcase ready. Lastly, it mentions ideas regarding ideas and thoughts, saving to separate locations for redundancy, placing in the cloud for remote access, and lately, press release once home free.

AIRPORT-INFORMATION.docx: The Airport Information doc contains Airport notes. It mentions that Reagan is the best on time and his route from Dulles to Indonesia. The document also mentions that there's a 22 min drive from the Fairfax Democratic Committee site to Dulles with a map image. This airport information shows the escape plan, links to the town hall target. It proves operational planning, metadata/timestamp, critical for the timeline.

LeftUsesBoycott: Matches the manifesto's anti-left behaviour, pro-gun, and shows suspect research media is looking through.

AIRPORT INFORMATION.docx	/img_LoneWolf.E01/vol_vol7/Users/jcloudy/Box Sync/Desktop/AIRPORT INFORMATION.docx	2018-04-04 22:21:10 EDT	297eec248647f33f887d72328ab56f3c

Cloud Storage Artifact Analysis

Looking through the CSV given by the forensics team, we were able to find the keys for his AWS bucket it was located in the downloads under the name of rootkey.csv, this file contained the private key for his S3 Bucket, making it so he had multiple file hosts that he would pull from He would also use OneDrive, and Google Drive, as well as Dropbox. The AWS bucket is used for his most classified files due to the fact that access to it is locked to the private key, making it so the only way to access the bucket is with the original key. Access is impossible since he needs the key and can't use passwords. He had it for backups he put copies of his Cloudy Manifesto in Dropbox and Google Drive he also added Operation 2nd Hand smoke into the bucket this was all found by looking through the keylog, and the screenshots is easy to tell that he was not very used to working with S3 buckets so he went for the route of using GUI based tool, that he is using for free. Judging by some of his search results, it's possible to tell that he never used AWS before making a lot of his things; he was looking at being his first time using them. Explaining why he was looking up so much about using S3 buckets. What Jim has done is make each of the cloud storage programs have back-ups of each other, making it so he has all the files across all of them. The point of doing this is that if one goes down, he has back-ups of each of the files, so no matter what happens. All of the clouds are signed up using the email address: jimcloudy1@gmail.com. This is for Google Drive, Dropbox, AWS bucket, Box, and he also uses OneDrive using jimcloudy@outlook.com as the email address, making it the only one to use a different email.

The timeline of cloud activity demonstrates a clear and organized pattern in the suspect's use of online storage services. CSV files provided by the forensic team revealed AWS credentials saved in the downloads folder as rootkey.csv, indicating that an Amazon S3 bucket was established early to store sensitive data more securely. Search history and keylog data indicate Jim researched how to use AWS and S3, indicating unfamiliarity, followed by implementation by a GUI tool. Over time, files such as the cloudy manifesto and operation 2nd hand smoke were kept on these services. By correlating account creation dates, recovered credentials, and screenshots, along with search activity. The timeline highlights a progression from digital planning and setup to redundancy for his attack.

Browser History and Search Analysis

Filtering through the CSVs provided in the Forensics output, we can see that the suspect had been searching as far back as 3/29/18 to 4/5/18, planning his attack and subsequent escape route. He had been searching for buildings to stage his attack on democratic buildings and the best places to escape to, the two of note being Vietnam and Indonesia. He had been looking at hotels in both countries as well as expat jobs once he arrived to have an income. His search had implied he was not sure how to upload his files and information to OneDrive and AWS, and also about the logistics of his trip, as he wondered if he could even have a foreign bank account. He had also been looking for ways to smuggle cash through American airports, presumably to foreign countries to start his new life, and had searched up if he could tape cash to himself through TSA at one point... It appears that Indonesia was his top choice as he looked at the conversion. His attack research had him searching for weapons intended to harm officials. He looked at weapons, which appeared constantly, such as 9mm, MP5s, and Fnp90. He had planned on researching how to sneak his weapons past TSA for his attack. The majority of his searches were on Google, and multiple accounts were created for services such as AWS on 3/27/18, Dropbox on 3/28/18, and Twitter on 3/28/18. Other accounts for services such as Outlook. All of these accounts were created using his personal email, Jimcloudy1@gmail.com. Additional digging brought up his current Chrome session, his Google Docs chat on his Google Docs file with his brother, whom he spoke with on the 6th repeatedly. He had also been looking for gear for his attack, repeatedly looking at velcro on Amazon and searching up velcro tear-away clothes and neck pouches.

Things he had bookmarked were Jim's notebook, which was created on 3/27/18 and last accessed on 4/16/18 at 6:14 am. Brother's chat was accessed on the same day and also created on the 31st of March 2018 at 7:20 am. Cloud account storage was Dropbox, as previously mentioned. On 4/6/18, he had to look at the weather report for Dulles Airport in Washington at 8:25 am.

He had been searching for the response times per zip code for law enforcement and had been concerned that the police had been searching his searches on the internet on 3/29/18 and 3/31/18, respectively. He had been looking into syncing his Amazon S3 data from his desktop to his device. He had been looking at shooting ranges and non-extradition countries as well as concealable tactical firearms, too, and airports near Washington DC. He had been looking into attending anti-gun rallies before his attack. Looking into overseas bank accounts and which states had the worst response times from law enforcement.

Image and Media Analysis

The LoneWolf_Image_Files.zip was downloaded and extracted. The E01 disk image was loaded into Autopsy as a data source. The discovery module filtered for images 16KB+ in size, and past occurrences were filtered to 1-10 occurrences. Three sections were used in the search. The discovery module identified 7 key images from the Chrome browser cache, and OneDrive recovered from the Windows user jcloudy. The search also included searching through downloads from the web. Lastly, EXIF metadata was found pointing out device data. This analysis focused on grabbing timestamps, file paths, hashes, EXIF metadata, and content relevance to the planned attack. The images spanned from March 31 to April 3, 2018. Provided MD5 hashes verified using FTK Imager before Analysis.

7 Key Images

The images (Table 1: Key Images) demonstrate that the suspect accessed extremist and weapon-related content during 36 hours between March 31, 14:41, and April 1, 2018, 21:48. The close timestamps across indicated that it was recent browser history activity. The images regarding the flight plan represent deliberate user action. The progression started from an idea → weapons research → operational planning directly supports the attack preparation narrative when you correlate it with the timestamps and browser history. The images weren't embedded with GPS coordinates as expected. All images were allocated, meaning the images weren't deleted. Images recovered from the allocated space also have verified hashes, maintaining the chain of custody.

F_001a20 shows "Strike Face" with a rifle. Shows access to violent imagery during the suspect's online research period, supporting weapon-related, radical, and intent.

F_001a0a shows the suspect is pro-gun rights with political messaging. Suggests suspect viewing gun-related content relevant to the motive development

F_0018c8: Anti-gun control and Nazi symbol. Indicates exposure to extremist propaganda and

supports the conclusion that the suspect consumed radical ideological material

F_0018ca: Quoting Adolf Hitler about disarming citizens. Supports extremist ideological research and helps explain suspects' anti-government and violent mindset

F_001bb7: Has an image of Washington DC viewed during the research period. Directly tied to the suspect researching the attack location

2018-04-03.png: Screenshot image of the American Airlines booking page for travel from Washington, DC to Denpasar. This user screenshot suggests deliberate travel planning activity

F_001e65: This image had EXIF metadata of a photo taken by a Samsung Galaxy S9 photo taken Feb 23, 2018, at 3:15. This means that there was device usage 5 weeks before the extremist images. The suspect had both a laptop and a phone

4 Key Web Downloads

Besides the 7 key images, it seems that there was a theme of political, guns, nazis, and airport travel plans to Washington supporting attack preparation. These patterns demonstrate that there was research rather than random browsing. Along with the 6 Key images, there were web downloads found showing the radical side of the suspect on March 31, 2018. Multiple images, such as the RedGuns.jpg and the BladeofGrass.jpg, show that active extremist sites were visited. The web downloads show deliberate intention beyond casual browsing. The downloads, such as the gun stats, Yamamoto rifle image, and DNC HQ photo, show that there was one focused attack planning session that ties with the suspect's ideologies to weapons and the Washington, DC target.s

RedGuns.jpg: Suspect downloaded a deleted RedGuns image showing deliberate action. Suspect collected imagery during a specific period of time, showing that it isn't just passive browsing.

DemGun.jpg: The image shows the Democratic National Headquarters (Washington) with a security guard at the entrance. Suspect continues to show signs of anti-government, shows attack planning area, and awareness of security.

DeathToll.jpg: The image shows what kills Americans, anti-gun control propaganda, and it downplays gun deaths vs diseases.

BladeofGrass.jpg: There is a woman with a rifle, quoting, "You cannot invade the mainland United States. There would be a rifle behind each blade of grass" - Japanese Admiral Yamamoto, 1941. This matches as it shows an armed citizen, an anti-invasion mindset, and it is in the relevant timeline.

Social Media and Account Identification

The examination by forensics had uncovered online identities, social media accounts, and cloud-based services associated with the suspect, Jim Cloudy. Further analysis of browser artifacts and saved Chrome credentials revealed that Jimcloudy1@gmail.com had served as his primary email address for registering and managing numerous online accounts. This personal

email of his was linked to key services, including Amazon Web Services (AWS), Twitter, Box, and Dropbox, with account creation dates ranging from March 27 to March 28, 2018. These artifacts are able to demonstrate consistent usage of a single identity across platforms, suggesting deliberate coordination. Most notably, the presence of saved login credentials and cached browser data provides strong evidence tying the suspect's device to these services, highlighting many different ways for communication, data storage, and cloud-based activity.

Further analysis had identified additional Microsoft-related accounts, including one created on April 2, 2018, and accessed through Microsoft's authentication portal. This account likely facilitated access to Outlook email and OneDrive, which was last accessed on April 5, 2018, indicating continued use of Microsoft's cloud ecosystem. Together, these findings illustrate a pattern of digital behaviour centred on cloud computing, file storage, and social media engagement. The recovered browser artifacts, such as saved credentials, login timestamps, and associated URLs, serve as critical digital evidence, establishing a timeline of account creation and usage. Collectively, these accounts provide insight into the suspect's online footprint and offer valuable leads for further investigative and evidentiary analysis.

Table 3: Account Information			
Service	Account	Creation Date	Url
Amazon Web Services (AWS)	jimcloudy1@gmail.com	March 27, 2018 – 11:53:50 PM	https://signin.aws.amazon.com/signin
	Content summary & Relevancy		
	A saved Chrome login links jimcloudy1@gmail.com to the Amazon Web Services sign-in portal. This indicates the use of a cloud computing platform associated with the suspect's browser profile.		
Service	Account	Creation Date	URL
Twitter	jimcloudy1@gmail.com	March 28, 2018 – 1:07:12 AM	https://twitter.com/login
	Content summary & Relevancy		
	A credential entry connects jimcloudy1@gmail.com to Twitter, identifying a social media account associated with the suspect. This account represents a potential avenue for communication and online activity.		
Service	Account	Creation Date	URL

Box	jimcloudy1@gmail.com	March 28, 2018 – 12:14:28 AM	https://account.box.com/signup/n/personal
	Content summary & Relevancy		
	The email jimcloudy1@gmail.com was recovered from a saved login for the Box platform. This artifact indicates the use of cloud storage services from the suspect's device.		
Service	Account	Creation Date	URL
Dropbox	jimcloudy1@gmail.com	March 28, 2018 – 12:02:41 AM	https://www.dropbox.com/register ⁷
	Content summary & Relevancy		
	A saved Chrome credential associates jimcloudy1@gmail.com with Dropbox. This suggests the suspect utilized cloud-based file storage or synchronization services.		
Service	Account	Creation Date	URL
Microsoft / Outlook	jimcloudy@outlook.com	April 2, 2018 – 1:45:38 AM	https://login.live.com/login.srf
	Content summary & Relevancy		
	A login artifact links jimcloudy@outlook.com to the Microsoft sign-in portal. This indicates an additional online identity potentially used for Outlook email and other Microsoft services.		

Application and System, Artifact Analysis

Finding the applications used most commonly, Jim used Google Chrome; this was his most used app because he used it to access most of his cloud storage sites, as well as accessing things like Google Docs and Gmail. The other reason he did this is that he uses it for researching places, buying his plane ticket, and watching YouTube. One of the big things he uses Google Docs for is a chat he has with his brother, meaning that his brother knew everything about Jim's plan. Jim also used Microsoft Word and PowerPoint; this is where he put most of his thoughts and his plan. He also used the S3 browser, which he used for interacting with his S3 bucket. Jim also uses Google Drive, Dropbox, and Box, which are all used as back-ups for all of his plans. This was all collected by looking through the screenshots. By reading all of the CSV files, they

would reinforce what was found in the screenshots, and by looking at the CSV files, it would show where each file was located, and by looking at them, you can find connections to what applications use each file directory that was attached to, especially with Onedrive, and Google Drive having dedicated folders on Jim's desktop.

Timeline Reconstruction

Jim Cloudy's activity began in late March 2018. Jim starts setting up online accounts and cloud storage tied to his main email. He creates AWS, Dropbox, Box, Twitter, and Microsoft accounts. He builds a digital footprint across several services. Now, around the same time, he browses searches about weapons, gun policy, attack targets, airport routes, and countries that are non-extradition, such as Vietnam and Indonesia.

From March 29 to April 1, Jim downloads and views political and violent images that include gun propaganda as well as anti-government material. His browser cache shows that he focused on specifically Washington, DC, and a trip to Denpasar, which matches his later escape idea. This period shows relevance as it links to research, ideology, and travel planning in a specific time period. This target search shows that Jim isn't browsing casually; he's forming a plan by collecting material for his Lone Wolf plan.

Later dates from April 2-3 show additional cloud and screenshot activity, including OneDrive use and files that are related to travelling. These artifacts show that Jim is preserving evidence across multiple locations, as he states in Cloudy Thoughts. On April 4, the main documents that Jim makes are the Cloudy Manifesto, Planning, Airport Information, and lastly the Cloudy Thoughts. The manifesto shows his anti-government beliefs and his violent intent. On the planning doc, it lists his plans to obtain weapons, supplies, a gun-free target near an airport, and an escape option. The airport file contains routes to Dulles and possible travel to Vietnam or Indonesia. Jim Cloudy's thoughts document shows his stress over weather concerns, and a clear note that he is saving everything in the cloud to back up

On April 5 and 6, Jim continues his cloud storage and speaks with his brother named Paul. This is relevant as Paul later becomes the person to warn the police. Jim checks Dulles' weather, which shows he is still looking at the weather conditions, showing his worries. Lastly, on April 7, Jim's plan is set in stone: obtaining weapons, attacking the target, fleeing through Dulles, and leaving the country if possible. Paul contacted authorities to stop Jim from executing his Lone Wolf plan.

Conclusion

The digital forensic investigation concluded that the suspect engaged in deliberate and methodical planning supported by extensive use of online resources, cloud storage services, and

multiple digital accounts. Evidence that had been recovered from browser history, cached images, downloaded files, and synchronized cloud platforms had revealed a thorough progression from ideological research to extreme logistical preparation and horrific operational intent. The suspect had clearly shown repeated searches related to weapons, potential targets, travel arrangements, and methods of evading law enforcement, demonstrating premeditation and coordinated planning.

Upon further analysis, it was noted that the use of cloud services such as Amazon Web Services, Google Drive, Dropbox, Box, and OneDrive was noted to store, organize, and back up critical documents. The artifacts recovered from the suspect's local systems included saved credentials and synchronization folders, confirming the presence of files such as The Cloudy Manifesto and Operation 2nd Hand Smoke. The discovery of AWS credentials from the rootkey.csv had pointed investigators to find additional evidence of Jim using secure cloud storage to hide and preserve sensitive material critical to his operation.

All conclusions were supported by verified forensic reports, including validated hash values, timestamps, and metadata, ensuring the integrity and authenticity of the evidence. The correlation of digital artifacts had allowed investigators to reconstruct a reliable timeline of events and establish the suspect's deadly intent. Ultimately, the investigation had concluded that the suspect attempted to systematically use digital technologies to plan and organize his activities. The plot, however, was not carried out, as authorities were alerted in time, preventing potential harm.

Table 3: Account Information			
Service	Account	Creation Date	Url
Amazon Web Services (AWS)	jimcloudy1@gmail.com	March 27, 2018 – 11:53:50 PM	https://signin.aws.amazon.com/signin
	Content summary & Relevancy		
	A saved Chrome login links jimcloudy1@gmail.com to the Amazon Web Services sign-in portal. This indicates the use of a cloud computing platform associated with the suspect's browser profile.		
Service	Account	Creation Date	URL
Twitter	jimcloudy1@gmail.com	March 28, 2018 – 1:07:12 AM	https://twitter.com/login
	Content summary & Relevancy		

	A credential entry connects jimcloudy1@gmail.com to Twitter, identifying a social media account associated with the suspect. This account represents a potential avenue for communication and online activity.		
Service	Account	Creation Date	URL
Box	jimcloudy1@gmail.com	March 28, 2018 – 12:14:28 AM	https://account.box.com/signup/n/personal
	Content summary & Relevancy		
	The email jimcloudy1@gmail.com was recovered from a saved login for the Box platform. This artifact indicates the use of cloud storage services from the suspect's device.		
Service	Account	Creation Date	URL
Dropbox	jimcloudy1@gmail.com	March 28, 2018 – 12:02:41 AM	https://www.dropbox.com/register ⁷
	Content summary & Relevancy		
	A saved Chrome credential associates jimcloudy1@gmail.com with Dropbox. This suggests the suspect utilized cloud-based file storage or synchronization services.		
Service	Account	Creation Date	URL
Microsoft / Outlook	jimcloudy@outlook.com	April 2, 2018 – 1:45:38 AM	https://login.live.com/login.srf
	Content summary & Relevancy		
	A login artifact links jimcloudy@outlook.com to the Microsoft sign-in portal. This indicates an additional online identity potentially used for Outlook email and other Microsoft services.
